

ELECTRONIC ANNUNCIATOR

The exciting new electronic annunciators from HCE add a whole new dimension to displaying patient and staff calls. Now your nurses can quickly see pending calls without returning to the nurse's desk!

Easy to read and see in any lighting, they are perfect for corridor junctions, nurse lounges, PBX, the nurse manager's office, or the nurse's station. They are fully programmable to display any or all call priority levels from one or many nursing units. Annunciators can either scroll or flash the information, as desired. Another option is tone generation.

The annunciators come in a variety of LED colors, number of display lines, and number of characters. The housing is ABS white plastic, they come ready to mount on the wall, and require just a serial cable for connections. Their size is compact: 13.7" long by 1.84" deep by 3.5" high. Multiple annunciators can be installed on a shared serial cable.

Electronic annunciators are designed to interface to the popular Cumula III nurse call system. Cumula III is a versatile, reliable nurse call system offering touchscreen nurse consoles, choice of patient station styles, interfaces to paging, infant abduction, patient wandering, and more. For more information on the electronic annunciators, or on the Cumula III, contact HCE.
